

Xiaotong Pseudo-code for 4750

#Other

```
def collect(images, scale, filters, window, overlap, border):
```

```
    Initialize features and number of features
```

```
    FOR all image in images DO:
```

```
        Extract the features of image by calling F = extract(image, scale, filters, window,  
overlap, borader)
```

```
        Update number of features and record the features F
```

```
        Check if feature size of F is consistant
```

```
    END FOR
```

```
    Combine all the features and adjust them according to the offset
```

```
    return the resulting features
```

```
def extract(image, scale, filters, window, overlap, border):
```

```
    Initialize the grid by calling grid = sampling_grid(X.shape, window, overlap, border,  
scale)
```

```
    Set feature size to be window[0] * window[1] * len(filters) * scale * scale
```

```
    if no filter is defined:
```

```
        Use grid to extract features from image
```

```
    else:
```

```
        for each filter in the filters:
```

```
            Use grid to extract features from the filtered image
```

```
            Combine the features together
```

```
        end for
```

```
    return the resulting features
```

```
def sampling_grid(imgSize, window, overlap, border, scale):
```

```
    Resize the window, overlap and boarder according to the scale
```

```
    Create sampling grid for overlapping window
```

```
    Adjust sampling grid according to the offset size
```

```
    return the resulting grid
```
